Subject: Ferrites on Cables

In Reference to the use of ferrites with the installation and use of the TA-500, the following are requirements established by API Healthcare for TA-500 Badge Reader Installations.

- 1) All installations are performed by Professional Installers.
- 2) The ferrite is included with all TA-500 readers sold by API Healthcare. The ferrite is required as part of the installation process and the installation process is covered on pages 15-18 of the installation guide.
- 3) The network cable is an existing cable, or a new cable, on an existing network. The network cables are professionally installed and the ferrite put on the installed cable as required by the TA-500 installation and configuration guide. The networks in use are all existing networks and therefore the ferrite cannot be a permanent installation.
- 4) The installed ferrite is also located in a junction box mounted in the wall behind the TA-500 rendering it inaccessible to the user or other unauthorized personnel.

The above justifies the use of a ferrite, included with the reader, and installed only by a professional installer.

Respectfully

A handwritten signature in dark ink, appearing to read "Gary Sutcliffe", is written above the printed name.
